Demers Coolant Shut-Off Valve Access and Location

ISSUE: The Demers ambulances incorporate an electronic coolant shut-off valve that opens for heat and closes for cooling. There may be instances where the rear heater doesn't produce heat, or the air conditioning doesn't produce cold air due to this valve sticking.

The valve is located behind the cabinet panel located on the left interior of the ambulance. The valve and hoses should be inspected and tested if the above concern has been indicated.

Be sure to neatly re-silicone the panel back in place.
